

mail2web.com Unveils Its Plans for Worldwide Support of the New iPhone from Apple

TORONTO-- June 28, 2007--(CNW)--The global leader in mobile collaboration and messaging solutions announced today that it will provide services to support the new iPhone which is recently launched by Apple.

iPhone is the much anticipated new mobile phone from Apple. Boasting a completely revolutionary touch screen user interface, the iPhone targets to reach both techno savvy and style conscious consumers.

mail2web.com provides services to consumers and businesses which enables them to have their important information to be in sync all the time between multiple PCs and mobile devices. Using Microsoft's Exchange Server and SharePoint Services platforms, mail2web.com creates a mobile virtual office that users can take anywhere.

"We provide our services to 16 million customers in 220 countries supporting 26 languages. We are excited to provide these services for iPhone users as well," said Stephen Nichols, Marketing Manager of mail2web.com.

"Mobile phones without connectivity to your important information are like cars without navigations systems. You can live without it, and you will never know what you are missing. But once you use it you cannot live without it. The convergence of mobility and connectivity is the next wave of Internet revolution," said Tony Yustein, Executive Chairman of mail2web.com.

mail2web.com offers services ranging from free to \$9.95 per month for consumers and businesses who want to access to their email and other important information like calendars, contacts, to-do list, important files and share them with friends or colleagues. Using Microsoft's ActiveSync and PUSH technology any changing information is delivered between multiple computers and mobile devices in seconds. This technology practically eliminates the need for propriety devices like BlackBerry phones, delivering the same information in the same or better speed and with same or better security. Consumers and businesses now have more freedom in which phone they want to use and which wireless provider they want to work with. BlackBerry service can only be fully experienced with limited BlackBerry hardware and with special data plans from wireless carriers. Whereas, with Microsoft ActiveSync PUSH technology consumers and businesses can choose from a wide range of mobile phones like Windows Mobile devices, Nokia, SonyEricsson, Samsung, Motorola and iPhone as the latest addition.

mail2web.com, a Microsoft Gold Certified partner with Excellence designation from Microsoft, was the first company that made it possible for consumers to try this technology free with mail2web.com LIVE services.

More information about mail2web.com's services can be reached at <http://services.mail2web.com>.
